Overview

The package germinationmetrics is a collection of functions which implements various methods for describing the time-course of germination in terms of single-value germination indices as well as fitted curves.

The goal of this vignette is to introduce the users to these functions and get started in describing sequentially recorded germination count data. This document assumes a basic knowledge of R programming language.

Installation

The package can be installed using the following functions:

```
# Install from CRAN
install.packages('germinationmetrics', dependencies=TRUE)

# Install development version from Github
devtools::install_github("aravind-j/germinationmetrics")
```

Then the package can be loaded using the function

```
library(germinationmetrics)
```

Version History

The current version of the package is 0.1.3. The previous versions are as follows.

Table 1. Version history of germinationmetrics R package.

Version	Date
0.1.0	2018-04-17
0.1.1	2018-07-26
0.1.1.1	2018-10-16
0.1.2	2018-10-31

To know detailed history of changes use news(package='germinationmetrics').

Germination count data

Typically in a germination test, the germination count data of a fixed number of seeds is recorded at regular intervals for a definite period of time or until all the seeds have germinated. These germination count data can be either partial or cumulative (Table 2).

Table 2: A typical germination count data.

intervals	counts	cumulative.counts
1	0	0
2	0	0
3	0	0
4	0	0
5	4	4
6	17	21
7	10	31
8	7	38
9	1	39
10	0	39
11	1	40
12	0	40
13	0	40
14	0	40

The time-course of germination can be plotted as follows:

Single-value germination indices

The details about the single-value germination indices implemented in **germinationmetrics** are described in Table 3.

 ${\bf Table~3:}~{\bf Single-value~germination~indices~implemented~in~germinationmetrics.}$

Germination index	function	Details	Unit	Measures	Reference
Germination percentage or Germinability (GP)	GermPercent	It is computed as follows: $GP = \frac{N_g}{N_t} \times 100$ Where, N_g is the number of germinated seeds and N_t is the total number of seeds.	Percentage (%)	Germination capacity	ISTA (2015)
Time for the first germination or Germination time lag (t_0)	FirstGermTime	It is the time for first germination to occur (e.g. First day of germination)	time	Germination time	Edwards (1932); Czabator (1962); Goloff and Bazzaz (1975); Labouriau (1983a); Ranal (1999); Quintanilla et al. (2000)
Time for the last germination (t_g)	LastGermTime	It is the time for last germination to occur (e.g. Last day of germination)	time	Germination time	Edwards (1932)
Time spread of germination or Germination distribution	TimeSpreadGerm	It is the difference between time for last germination (t_g) and time for first germination (t_0) . Time spread of germination $= t_g - t_0$	time	Germination time	Al-Mudaris (1998); Schrader and Graves (2000); Kader (2005)
Peak period of germination or Modal time of germination	PeakGermTime	It is the time in which highest frequency of germinated seeds are observed and need not be unique.	time	Germination time	Ranal and Santana (2006)
Median germination time (t_{50}) (Coolbear)	t50	It is the time to reach 50% of final/maximum germination. With argument method specified as "coolbear", it is computed according to the formula by (Coolbear et al., 1984) as follows: $t_{50} = T_i + \frac{(\frac{N+1}{2} - N_i)(T_j - T_i)}{N_j - N_i}$ Where, t_{50} is the median germination time, N is the final number of germinated seeds and N_i and N_j are the total number of seeds germinated in adjacent counts at time T_i and T_j respectively, when $N_i < \frac{N+1}{2} < N_j$.	time	Germination time	Coolbear et al. (1984)

Germination index	function	Details	Unit	Measures	Reference
Median germination time (t_{50}) (Farooq)	t50	With argument method specified as "farooq", it is computed according to the formula by (Coolbear et al., 1984) as follows: $t_{50} = T_i + \frac{(\frac{N}{2} - N_i)(T_j - T_i)}{N_j - N_i}$ Where, t_{50} is the median germination time, N is the final number of germinated seeds and N_i and N_j are the total number of seeds germinated in adjacent counts at time T_i and T_j respectively, when $N_i < \frac{N}{2} < N_j$.	time	Germination time	Farooq et al. (2005)
Mean germination time or Mean length of incubation time (\overline{T}) or Germination resistance (GR) or Sprouting index (SI)	MeanGermTime	It is the average length of time required for maximum germination of a seed lot and is estimated according to the following formula. $\overline{T} = \frac{\sum_{i=1}^k N_i T_i}{\sum_{i=1}^k N_i}$ Where, T_i is the time from the start of the experiment to the i th observation, N_i is the number of seeds germinated in the i th time (not the accumulated number, but the number correspondent to the i th observation) and k is the last time of germination. It is the inverse of mean germination rate (\overline{V}) . $\overline{T} = \frac{1}{\overline{V}}$	time	Germination time	Edmond and Drapala (1958); Czabator (1962); Smith and Millet (1964); Gordon (1969); Gordon (1971); Ellis and Roberts (1980) Labouriau (1983a); Ranal and Santana (2006)
Variance of germination time (s_T^2)	VarGermTime	It is computed according to the following formula. $s_T^2 = \frac{\sum_{i=1}^k N_i (T_i - \overline{T})^2}{\sum_{i=1}^k N_i - 1}$ Where, T_i is the time from the start of the experiment to the i th observation, N_i is the number of seeds germinated in the i th time (not the accumulated number, but the number correspondent to the i th observation) and k is the last time of	time	Germination time	Labouriau (1983a); Ranal and Santana (2006)

germination.

Germination	function	Details	Unit	Measures	Reference
Standard error of germination time $(s_{\overline{T}})$	SEGermTime	It signifies the accuracy of the calculation of the mean germination time. It is estimated according to the following formula:	time	Germination time	Labouriau (1983a); Ranal and Santana (2006)
		$s_{\overline{T}} = \sqrt{\frac{s_T^2}{\sum_{i=1}^k N_i}}$			
		Where, N_i is the number of seeds germinated in the <i>i</i> th time (not the accumulated number, but the number correspondent to the <i>i</i> th observation) and k is the last time of germination.			
Mean germination rate	MeanGermRate	It is computed according to the following formula:	${\rm time^{-1}}$	Germination rate	Labouriau and Valadares (1976); Labouriau
(\overline{V})		$\overline{V} = \frac{\sum_{i=1}^{k} N_i}{\sum_{i=1}^{k} N_i T_i}$		1400	(1976); Labouriau (1983b); Ranal and Santana (2006)
		Where, T_i is the time from the start of the experiment to the i th observation, N_i is the number of seeds germinated in the i th time (not the accumulated number, but the number correspondent to the i th observation) and k is the last time of germination. It is the inverse of mean germination time (\overline{T}) .			
		$\overline{V} = \frac{1}{\overline{T}}$			
Coefficient of velocity of germination (CVG) or Coefficient of rate of germination (CRG) or	CVG	It is estimated according to the following formula. $CVG = \frac{\sum_{i=1}^k N_i}{\sum_{i=1}^k N_i T_i} \times 100$ $CVG = \overline{V} \times 100$	% day ⁻¹	Germination rate	Kotowski (1926), Nichols and Heydecker (1968); Bewley and Black (1994); Labouriau (1983b); Scott et al. (1984)
Kotowski's coefficient of velocity		Where, T_i is the time from the start of the experiment to the i th observation, N_i is the number of seeds germinated in the i th time (not the accumulated number, but the number correspondent to the i th observation) and k is the last time of germination.			
Variance of germination rate (s_V^2)	VarGermRate	It is calculated according to the following formula. $s_V^2=\overline{V}^4\times s_T^2$ Where, s_T^2 is the variance of germination time.	time ⁻²	Germination rate	Labouriau (1983b); Ranal and Santana (2006)

6

Germination index	function	Details	Unit	Measures	Reference
Standard error of germination rate $(s_{\overline{V}})$	SEGermRate	It is estimated according to the following formula. $s_{\overline{V}} = \sqrt{\frac{s_V^2}{\sum_{i=1}^k N_i}}$ Where, N_i is the number of seeds germinated in the i th time (not the accumulated number, but the number correspondent to the i th observation) and k is the last time of germination.	time ⁻¹	Germination rate	Labouriau (1983b); Ranal and Santana (2006)
Germination rate as the reciprocal of the median time (v_{50})	GermRateRecip	It is the reciprocal of the median germination time (t_{50}) . $v_{50} = \frac{1}{t_{50}}$	${ m time}^{-1}$	Germination rate	Went (1957); Labouriau (1983b); Ranal and Santana (2006)
Speed of germination or Germination rate Index or index of velocity of germination or Emergence rate index (Germination index according to AOSA)	GermSpeed	It is the rate of germination in terms of the total number of seeds that germinate in a time interval. It is estimated as follows: $S = \frac{N_1}{T_1} + \frac{N_2}{T_2} + \frac{N_3}{T_3} + \dots + \frac{N_n}{T_n}$ Where, $N_1, N_2, N_3, \dots, N_n$ are the number of germinated seeds observed at time (days or hours) $T_1, T_2, T_3, \dots, T_n$ after sowing. (Not accumulated/cumulative number, but the number of seeds that germinated at the specific time). Instead of germination counts, germination percentages may also be used for computation of speed of germination.	$\% { m time}^{-1}$	Mixed	Throneberry and Smith (1955); Maguire (1962); Allan et al. (1962); Kendrick and Frankland (1969); Bouton et al. (1976); AOSA (1983); Khandakar and Bradbeer (1983); Bradbeer (1988); Wardle et al. (1991)
Speed of accumulated germination	GermSpeedAccumulate	It is estimated as follows: $S_{accumulated} = \frac{N_1}{T_1} + \frac{N_1 + N_2}{T_2} + \frac{N_1 + N_2 + N_3}{T_3} + \dots + \frac{N_1 + N_2}{T_2}$ Where, $N_1, N_2, N_3, \dots, N_n$ are the number of germinated seeds observed at time (days or hours) $T_1, T_2, T_3, \dots, T_n$ after sowing. (Not accumulated/cumulative number, but the number of seeds that germinated at the specific time). Instead of germination counts, germination percentages may also be used for computation of speed of germination.	$\% \ { m time^{-1}}$	Mixed	Bradbeer (1988); Wardle et al. (1991); Haugland and Brandsaeter (1996); Santana and Ranal (2004)
Corrected germination rate index	GermSpeedCorrected	· · · · · · · · · · · · · · · · · · ·	${ m time^{-1}}$	Mixed	Evetts and Burnside (1972)

Germination index	function	Details	Unit	Measures	Reference
Weighted germination percentage (WGP)	WeightGermPercent	It is estimated as follows: $WGP = \frac{\sum_{i=1}^{t} (t-i+1)N_i}{t\times N}\times 100$ Where, N_i is the number of seeds that germinated in the time interval i (not cumulative, but partial count), N is the total number of seeds tested and t is the total number of time intervals.		Mixed	Reddy et al. (1985); Reddy (1978)
Mean germination percentage per unit time (\overline{GP})	MeanGermPercent	It is estimated as follows: $\overline{G} = \frac{GP}{T_n}$ Where, GP is the final germination percentage and T_n is the total number of intervals(e.g. days) required for final germination.		Mixed	Czabator (1962)
Number of seeds germinated per unit time \overline{N}	MeanGermNumber	It is estimated as follows: $\overline{N} = \frac{N_g}{T_n}$ Where, N_g is the number of germinated seeds and T_n is the total number of intervals (e.g. days) required for final germination.		Mixed	Khamassi et al. (2013)
Timson's index $[\sum 10 \text{ (Ten summation)}, \sum 5 \text{ or } \sum 20] \text{ or Germination energy index } (GEI)$	TimsonsIndex	It is the progressive total of cumulative germination percentage recorded at specific intervals for a set period of time and is estimated in terms of cumulative germination percentage (G_i) as follows: $\sum n = \sum_{i=1}^t G_i$ Where, G_i is the cumulative germination percentage in time interval i and t is the total number of time intervals. It also estimated in terms of partial germination percentage as follows: $\sum n = \sum_{i=1}^t g_i(t-j)$ Where, g_i is the germination (not cumulative, but partial germination) in time interval i (i varying from 0 to t) and t is the total number of time intervals and $j = i-1$.		Mixed	Grose and Zimmer (1958); Timson (1965); Brown and Mayer (1988); Baskin and Baskin (1998); Goodchild and Walker (1971)

Germination index	function	Details	Unit	Measures	Reference
Modified Timson's index (Labouriau)	TimsonsIndex	It is estimated as Timson's index T divided by the sum of partial germination percentages. $T_{mod} = \frac{T}{\sum_{i=1}^t g_i}$		Mixed	Ranal and Santana (2006)
Modified Timson's index (Khan and Unger)	TimsonsIndex	It is estimated as Timson's index (T) divided by the number of intervals $(t).$ $T_{mod} = \frac{T}{t} \label{eq:Tmod}$		Mixed	Khan and Ungar (1984)
George's index	GermRateGeorge	It is estimated as follows: $GR = \sum_{i=1}^t N_i K_i$ Where N_i is the number of seeds germinated by i th interval and K_i is the number of intervals(eg. days) until the end of the test.		Mixed	George (1961); Tucker and Wright (1965); Nichols and Heydecker (1968)
Peak value(PV) (Czabator) or Emergence Energy (EE)	PeakValue	It is the accumulated number of seeds germinated at the point on the germination curve at which the rate of germination starts to decrease. It is computed as the maximum quotient obtained by dividing successive cumulative germination values by the relevant incubation time.		Mixed	Czabator (1962); Bonner (1967)
Germination value (GV) (Czabator)	GermValue	It is computed as follows: $GV = PV \times MDG$ Where, PV is the peak value and MDG is the mean daily germination percentage from the onset of germination. It can also be computed for other time intervals of successive germination counts, by replacing MDG with the mean germination percentage per unit time (\overline{GP}) .		Mixed	Czabator (1962)

Germination index	function	Details	Unit	Measures	Reference
Germination value (GV) (Diavanshir and Pourbiek)	GermValue	It is computed as follows: $GV = \frac{\sum DGS}{N} \times GP \times k$ Where, DGS is the daily germination speed computed by dividing cumulative germination percentage by the number of days since the since the onset of germination, N is the frequency or number of DGS calculated during the test, GP is the germination percentage expressed over 100 and k is a constant. The value of k is decided on the basis of average daily speed of germination $(\frac{\sum DGS}{N})$. If it is less than 10, then k value of 10 can be used and if it is more than 10, then value of 7 or 8 can be used for k . GV value can be modified (GV_{mod}) , to consider the entire duration from the beginning of the test instead of just from the onset of germination.		Mixed	Djavanshir and Pourbeik (1976); Brown and Mayer (1988)
Coefficient of uniformity of germination (CUG)	CUGerm	It is computed as follows: $CV_T = \frac{\sum_{i=1}^k N_i}{\sum_{i=1}^k (\overline{T} - T_i)^2 N_i}$ Where, \overline{T} is the the mean germination time, T_i is the time from the start of the experiment to the i th observation (day for the example); N_i is the number of seeds germinated in the i th time (not the accumulated number, but the number correspondent to the i th observation), and k is the last time of germination.		Germinatin unifromity	Heydecker (1972); Bewley and Black (1994)
Coefficient of variation of the germination time (CV_T)	CVGermTime	It is estimated as follows: $CV_T=\sqrt{\frac{s_T^2}{\overline{T}}}$ Where, s_T^2 is the variance of germination time and \overline{T} is the mean germination time.		Germinatin unifromity	Ranal and Santana (2006)
Synchronization index (\overline{E}) or Uncertainty of the germination process (U) or informational entropy (H)	GermUncertainty	It is estimated as follows: $\overline{E} = -\sum_{i=1}^k f_i \log_2 f_i$ Where, f_i is the relative frequency of germination $(f_i = \frac{N_i}{\sum_{i=1}^k N_i}), N_i \text{ is the number of seeds germinated on the}$ i th time and k is the last day of observation.	bit	Germination synchrony	Shannon (1948); Labouriau and Valadares (1976); Labouriau (1983b)

Germination index	function	Details	Unit	Measures	Reference
Synchrony of germination (Z index)	GermSynchrony	It is computed as follows: $Z = \frac{\sum_{i=1}^k C_{N_i,2}}{C_{\Sigma N_i,2}}$ Where, $C_{N_i,2}$ is the partial combination of the two germinated seeds from among N_i , the number of seeds germinated on the i th time (estimated as $C_{N_i,2} = \frac{Ni(Ni-1)}{2}$) and $C_{\Sigma N_i,2}$ is the partial combination of the two germinated seeds from among the total number of seeds germinated at the final count, assuming that all seeds that germinated did so simultaneously.		Germination synchrony	Primack (1985); Ranal and Santana (2006)

Curve fitting

Several mathematical functions have been used to fit the cumulative germination count data and describe the germination process such as Richard's, Weibull, logistic, log-logistic, gaussian, four-parameter hill function etc. Currently germinationmetrics implements the four-parameter hill function to fit the count data and computed various associated metrics.

Four-parameter hill function

The four-parameter hill function defined as follows (El-Kassaby et al., 2008):

$$f(x) = y = y_0 + \frac{ax^b}{x^b + c^b}$$

Where, y is the cumulative germination percentage at time x, y_0 is the intercept on the y axis, a is the asymptote, b is a mathematical parameter controlling the shape and steepness of the germination curve and c is the "half-maximal activation level".

The details of various parameters that are computed from this function are given in Table 4.

Table 4 Germination parameters estimated from the four-parameter hill function.

Germination parameters	Details	Unit	Measures
y intercept (y_0)	The intercept on the y axis.		
Asymptote (a)	It is the maximum cumulative germination percentage, which is equivalent to germination capacity.	%	Germination capacity
Shape and steepness (b)	Mathematical parameter controlling the shape and steepness of the germination curve. The larger the b , the steeper the rise toward the asymptote a , and the shorter the time between germination onset and maximum germination.		Germination rate
Half-maximal activation level (c)	Time required for 50% of viable seeds to germinate.	time	Germination time
lag	It is the time at germination onset and is computed by solving four-parameter hill function after setting y to 0 as follows: $lag = b\sqrt{\frac{-y_0c^b}{a+y_0}}$	time	Germination time
D_{lag-50}	The duration between the time at germination onset (lag) and that at 50% germination (c) .	time	Germination time

Germination parameters	Details	Unit	Measures
$\overline{t_{50_{total}}}$	Time required for 50% of total seeds to germinate.	time	Germination time
$t_{50_{germinated}}$	Time required for 50% of viable/germinated seeds to germinate	time	Germination time
$t_{x_{total}}$	Time required for $x\%$ of total seeds to germinate.	time	Germination time
$t_{x_{germinated}}$	Time required for $x\%$ of viable/germinated seeds to germinate	time	Germination time
Uniformity $(U_{t_{max}-t_{min}})$	It is the time interval between the percentages of viable seeds specified in the arguments umin and umin to germinate.	time	Germination time
Time at maximum germination rate $(TMGR)$	The partial derivative of the four-parameter hill function gives the instantaneous rate of germination (s) as follows:	time	Germination time
	$s = \frac{\partial y}{\partial x} = \frac{abc^b x^{b-1}}{(c^b + x^b)^2}$		
	From this function for instantaneous rate of germination, $TMGR$ can be estimated as follows:		
	$TMGR = b\sqrt{\frac{c^b(b-1)}{b+1}}$		
	It represents the point in time when the instantaneous rate of germination starts to decline.		
Area under the curve (AUC)	It is obtained by integration of the fitted curve between time 0 and time specified in the argument tmax.		Mixed
MGT	Calculated by integration of the fitted curve and proper normalisation.	time	Germination time
Skewness	It is computed as follows:		
	$\frac{MGT}{t_{50_{germinated}}}$

Wrapper functions

Wrapper functions germination.indices() and FourPHFfit.bulk() are available in the package for computing results for multiple samples in batch from a data frame of germination counts recorded at specific time intervals.

germination.indices()

This wrapper function can be used to compute several germination indices simultaneously for multiple samples in batch.
